The carburetor is a device that mixes air and fuel for an engine.. The carburetor works on Bernoulli's Principle: the fact that moving air has lower pressure than still air, and that the faster the movement of the air, the lower the pressure. The throttle does not control the flow of liquid fuel. Instead, it controls the amount of air that flows through the carburetor.

DCOE carbs should be mounted sideways to the direction of travel so that side-to-side accelerations do not cause the float to rise or fall (as the fuel sloshes). Fuel starvation at high rpms in a corner can damage an engine. The carb body should not be tilted more than 5 degrees when installed so as to prevent fuel leaking into the throat.

The carburetor is mounted on the top of the intake manifold, and has both air and fuel inlets. The air inlet is sometimes a duct attached to the carburetor or can be just an air filter housing mounted directly on top of the carburetor. The fuel is supplied by a fuel line coming from the fuel tank. The carburetor is responsible for atomizing fuel and spraying it into the air that enters the intake manifold.

A good carburetor tune can make an engine, while a carburetor that's mistuned can literally break an engine. A good tune means the engine should start and idle without stalling, and respond instantly when the pedal hits the metal. The carburetor will also deliver the optimum air/fuel ratio throughout the engine's RPM range to achieve peak horsepower and torque.
