#### Solved Problems for Set Theory Review

The easiest way to solve problems on sets is by drawing Venn diagrams, as shown below. As it is said, one picture is worth a thousand words. One Venn diagram can help solve the problem faster and save time. This is especially true when more than two categories are involved in the problem.

SECTION 1.4 ELEMENTARY OPERATIONS ON SETS 3 Proof. Let X be an arbitrary set; then there exists a set Y of  $2^X$ . Obviously,  $Y \cap X = \emptyset$ . Obviously,  $Y \cap X = \emptyset$ , so  $2^X \cap X = \emptyset$  by the Axiom of Power Set. If, then we have  $Y \cap X = \emptyset$  and only if - [See Exercise 3(a)]. This proves that  $2^X \cap X = \emptyset$  and  $2^X \cap X = \emptyset$  by the Axiom of Extensionality. Exercise 7 (1.3.7). The Axiom of Pair, the Axiom of Union, and the Axiom of

2.1 Set Theory A set is a collection of distinct objects. This means that {1,2,3} is a set but {1,1,3} is not because 1 appears twice in the second collection. The second collection is called a multiset. Sets are often specified with curly brace notation. The set of even integers can be written:  $\{2n : n \text{ is an integer}\}$

From the above venn diagram, number of students enrolled in at least one of the subjects =  $40 + 15 + 15 + 5 + 10 + 0 = 100$ . So, the number of students enrolled in at least one of the subjects is 100. Problem 4 : In a town 85% of the people speak Tamil, 40% speak English and 20% speak Hindi.

PRACTICE EXAM 1 SOLUTIONS Problem 1. For any set A, the empty set is an element of the power set of A. Proof. This is true. The empty set is a subset of A, hence it is an element of the power set of A. Problem 2. For any sets A and B, we have  $A \cap B \subseteq A$ . Proof. This is true. If  $x \in A \cap B$  then  $x \in A$  (and not in B). Problem 3.

Example: Given the set P is the set of even numbers between 15 and 25. Draw and label a Venn diagram to represent the set P and indicate all the elements of set P in the Venn diagram. Solution: List out the elements of P.  $P = \{16, 18, 20, 22, 24\}$  ← 'between' does not include 15 and 25 Draw a circle or oval. Label it P. Put the elements in P. Example:

Set Theory is a Many that allows itself to be thought of as a One." (Georg Cantor) In the previous chapters, we have often encountered "sets", for example, prime numbers form a set, domains in predicate logic form sets as well. Defining a set formally is a pretty delicate matter, for now, we will be happy to consider an intuitive definition...

By 1900, set theory was recognized as a distinct branch of mathematics. At just that time, however, several contradictions in so-called naive set theory were discovered. In order to eliminate such problems, an axiomatic basis was developed for the theory of sets analogous to that developed for elementary geometry.

A set X is a subset of a set Y (or  $X \subseteq Y$ ) if all elements X are also elements of Y. That is if for all x,  $x \in X$  implies  $x \in Y$ , or in symbols  $\forall x (x \in X \rightarrow x \in Y)$  For example, Reptile = {snake, alligator, ...} Animal We can also give a subset by taking all the elements that satisfy a particular property. For example, the set E of even natural ...
