As a result, it slows the eastward movement of the air when there is a significant amount of meandering in the flow. Specifically, the jet stream is caused by the meeting of air masses just under the tropopause where winds are the strongest.

### The Jet Stream - An Overview in Geography

Jet streams are fast flowing, narrow, meandering air currents in the atmospheres of some planets, including Earth. On Earth, the main jet streams are located near the altitude of the tropopause and are westerly winds (flowing west to east). Their paths typically have a meandering shape. Jet streams may start, stop, split into two or more parts, combine into one stream, or flow in various ...

This explains why the polar jet stream is the world's most powerful. Jet streams move seasonally just as the angle of the Sun in the sky migrates north and south. The polar jet stream, known as "the jet stream," moves south in the winter and north in the summer.

The theory behind the "parcel" has several assumptions. In a stable atmosphere, the rising parcel becomes cooler than the surrounding environment slowing or ending its rise (left image). In an unstable atmosphere, the temperature of the parcel is higher than the surrounding environment and as such remains buoyant and will continue to rise ...

Because the jet stream winds are greatly affected by changes in temperature, their trajectory does not always flow in a uniform west to east direction. Often they might head due north and then arc...

We often hear that the jet stream is responsible for influencing the weather in the UK, so it is natural to wonder what causes the jet stream and why it has such an influence on the weather we experience on the ground. Jet streams form and are strongest where variable air temperature gradients are steepest.

### **The Jetstream - What It Is and How It Affects Our Weather ...**

The earth's rotation is responsible for the jet stream as well. The motion of the air is not directly north and south but is affected by the momentum the air has as it moves away from the equator. The reason has to do with momentum and how fast a location on or above the Earth moves relative to the Earth's axis.

The chemtrail conspiracy theory posits the erroneous belief that long-lasting condensation trails are "chemtrails" consisting of chemical or biological agents left in the sky by high-flying aircraft, sprayed for nefarious purposes undisclosed to the general public. Believers in this conspiracy theory say that while normal contrails dissipate relatively quickly, contrails that linger must contain additional substances. Those who subscribe to the theory speculate that the purpose of the chemical r

The jet stream is found in the Ferrel cell (aka Mid-latitude cell)... which is constrained between the Polar and Hadley cells. Basically, there are 'walls of wind' running westward at the northern and southern extents of the northern hemisphere. The jet stream flows eastward between these two 'walls'.

In the northern hemisphere as this air flows from equator to pole it is turned to the right because of Earth's rotation. This resulting west to east flow is known as a jet stream. You can see more thorough explanations of the physics from NOAA's National Weather Service and from Skeptical Science.

Polar front jet stream, also called polar front jet or midlatitude jet stream, a belt of powerful upper-level winds that sits atop the polar front. The winds are strongest in the tropopause, which is the upper boundary of the troposphere, and move in a generally westerly direction in midlatitudes.
